let

$$I_1 = \int_{-\infty}^{+\infty} ye^{\left(\frac{3xy}{2}-2y^2\right)} dy \quad (0.0.10)$$

$$I_1 = \frac{-1}{4} \left[\int_{-\infty}^{+\infty} \left(\frac{3x}{2} - 4y \right) e^{\left(\frac{3xy}{2}-2y^2\right)} dy \right] - \frac{3}{2} x \frac{(-1)}{4} \left[\int_{-\infty}^{+\infty} e^{\left(\frac{3}{2}xy-2y^2\right)} dy \right] \quad (0.0.11)$$

On solving (0.0.11) using (0.0.5) and integration rules we get

$$\int_{-\infty}^{+\infty} ye^{\left(\frac{3xy}{2}-2y^2\right)} dy = \frac{3x}{8} \sqrt{\frac{\pi}{2}} e^{\frac{9x^2}{32}} \quad (0.0.12)$$

Substituting (0.0.12) in (0.0.9) we get

$$E(XY) = \frac{1}{\sqrt{2\pi}} \frac{3}{8} \int_{-\infty}^{+\infty} x^2 e^{-\frac{x^2}{2}} dx \quad (0.0.13)$$

Solving this using (0.0.6) we get

$$E(XY) = \frac{3}{8} \quad (0.0.14)$$

$$\therefore 8E(XY) = 3 \quad (0.0.15)$$

GATE 2021 XE-A QUESTION 7(PG:9)

Let (X, Y) have a bivariate normal distribution with the joint probability density function

$$f_{X,Y}(x, y) = \frac{1}{\pi} e^{\left(\frac{3}{2}xy - \frac{25}{32}x^2 - 2y^2\right)} \quad (0.0.1)$$

$$-\infty < x, y < \infty \quad (0.0.2)$$

Then $E(XY)$ equals

SOLUTION

Given probability density function for (X, Y)

$$f_{X,Y}(x, y) = \frac{1}{\pi} e^{\left(\frac{3}{2}xy - \frac{25}{32}x^2 - 2y^2\right)} \quad (0.0.3)$$

$$-\infty < x, y < \infty \quad (0.0.4)$$

$$\int_{-\infty}^{+\infty} e^{-(ax^2+bx+c)} = \sqrt{\frac{\pi}{a}} e^{\frac{b^2-4ac}{4a}} \quad (0.0.5)$$

$$2 \int_{-\infty}^{+\infty} x^2 e^{-x^2} = \int_{-\infty}^{+\infty} e^{-x^2} = \sqrt{\pi} \quad (0.0.6)$$

We need to find $E(XY)$

$$E(XY) = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} xy f_{X,Y}(x, y) dy dx \quad (0.0.7)$$

$$= \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} xy \frac{1}{\pi} e^{\left(\frac{3}{2}xy - \frac{25}{32}x^2 - 2y^2\right)} dy dx \quad (0.0.8)$$

$$= \frac{1}{\pi} \int_{-\infty}^{+\infty} x e^{-\frac{25}{32}x^2} \int_{-\infty}^{+\infty} y e^{\left(\frac{3}{2}xy - 2y^2\right)} dy dx \quad (0.0.9)$$
